Practical Exercise 7-2 Uninstalling RPM Packages:

This Practical Exercise will take students through the uninstall of an application (Nano) using the rpm utility.

The last PE took you through the process of downloading a package via the wget utility and the install of a package using rpm. You should still have the snapshot 8-2 running from that exercise:

1. If the image screen has gone black click anywhere in the black and press **CTRL+ALT** to bring up the terminal. You should have a root prompt but if you were logged out login as root with the username: **root** and the password: **student**.

2. Uninstalling the Nano application is going to be easy simply enter **rpm -e nano**.

3. You can verify that it is uninstalled by entering **whereis nano** and you should get nothing returned. Enter **nano file1** and you should see that Nano is not installed nor is the file.

4. You can now close the 8-2 snapshot.
